

ADVANCED CARBONS: production and use

The main product of this technology is a char produced through thermochemical treatment of organic waste and functionalized for several specific applications by engineering the functionalization methods.

The service offered includes the recovery process of the feedstock, possibly also on-site where it is generated.

The main application of these carbons is wastewater treatment and water remediation, but they can be used also for other targets, including agricultural soil improvement as well as recovery/reuse of nutrients from wastewater.

"Advanced Carbons: from waste to useful materials"

Keyword

Waste valorization, Funzionalized char, Carbon negative emissions, circular economy

Fig. 1: Advanced carbons derive from organic by-products or waste, containing carbon of biological origin, fossil carbon and mineral components (metals, alkalis and other inorganic components) for the prepara

Fig. 2: Functionalized advanced chars: structure and applications.

Descrizione

List of services:

- Develop recovery, recycling and reutilisation pathways from biogenic residues, waste and recycled fossil material up to carbon-based materials regeneration.
- Design of newly functional and composite materials to recover nutrients and to remove pollutants, with new chemical and microbial functionalisation.
- Production of biogenic carbon-based materials and related laboratory tests.
- Production of soil improvers from compost and carbon-based materials co-maturation.
- Bio-engineering of carbon-based materials.
- Prediction of long-term effects and carbon sequestration potentials.

Aspetti innovativi

Innovative technologies and related available skills:

- Creation of a valid alternative to activated carbon with a cheaper waste-derived material that can be also useful for specific applications.
- Implementation of a small and medium-scale on-site production and characterization of advanced carbons from agricultural residues in a view of industrial symbiosis.
- New and cheaper methods of functionalization of advanced carbons for peculiar purposes.
- Production of composite advanced carbon for nutrient recovery (P and N).
- Implementations of techniques for the removal and valorisation of ammonia in waste sewage.
- Use of advanced carbon enriched with nutrients for composting.
- Study of the interaction between microorganisms and advanced carbons (mechanisms and applications).

Applicazioni

Adsorbent materials (alternative to activated carbons)

- Treatment of urban and industrial effluents: recovery of nutrients (P, N) and critical raw materials
- Soil and water remediation

Specific uses

- Batteries, accumulators, super condensers
- CO₂ recovery and management

Modelling (Simulations, experiments, field observations)

Integration of different models (mathematical, physical, bio-ecological, economic and social) for:

- Evaluation of environmental systems (e.g. soil quality)
- Agricultural soil improvement
- Carbon storage in soils, carbon credits

Fig. 3: Application of biochar for water remediation in a Pump & Treat plant

Esempio di applicazione

Pruning valorisation and wastewater treatment: an industrial symbiosis process.

A contract is underway with a company for the development of advanced vegetable carbons for the replacement of activated carbons in the filtering of polluted waters and in the recovery of polluted soils. The project takes place under a framework agreement and references are subject to a confidentiality agreement.

However, the technology is aimed at any stakeholder who is interested in the valorisation of organic waste of biological and non-biological origin, but also at those interested in the application of functionalized materials.

Partner coinvolti	Fraunhofer Institute
Tempi di realizzazione	48 mesi/persona
Livello di maturità tecnologica	TRL4 - Technology validated in lab
Valorizzazione applicazione	Patenting and business model under development

CIRI FRAME

Centro Interdipartimentale di Ricerca Industriale Fonti Rinnovabili, Ambiente, Mare ed Energia

Il Centro Interdipartimentale per la ricerca Industriale (CIRI) Fonti Rinnovabili, Ambiente, Mare ed Energia dell'Università di Bologna sviluppa attività di ricerca applicata di interesse industriale su differenti tematiche. La finalità del CIRI FRAME è quella di promuovere, coordinare e svolgere attività di ricerca industriale, di promozione dei risultati della ricerca e di trasferimento tecnologico, in stretta interazione con le aziende, nel campo delle fonti rinnovabili di materie prime e di energia; dello studio e della salvaguardia dell'ambiente; dello studio e dell'uso del mare e delle coste; della sostenibilità nella produzione e uso dell'energia; della riduzione dell'emissione di gas clima-alteranti. Si articola in 3 Unità Operative (U.O.): "Fonti Rinnovabili e Sostenibilità" (FRS), "Risorse Marine e Crescita Blu" (RMCB), "Tecnologie per l'Energia e l'Ambiente" (TEA). È distribuito sui territori di Ravenna e Rimini, dove è attivo all'interno dei tecnopoli regionali, e su quello di Bologna, dove agisce in collaborazione con i Dipartimenti di Unibo afferenti al CIRI.
